Corporate leaders in Brazil, a nation where most workers are employed by small businesses, are often wary of the Amazon. However, in a special issue about the problems in small businesses elsewhere in the world, we get to be raised just below Amazon.com, but not just in the financial realm. Amazon.com is also in the top 100 in the *Entrepreneur* magazine's annual survey of small businesses. Amazon.com is also in the top 100 in the *Entrepreneur* magazine's annual survey of small businesses. Amazon.com is also in the top 100 in the *Entrepreneur* magazine's annual survey of small businesses.

It is possible to put a narrow class of first-degree homogeneous first-order logic formulas in prenex normal form that are not satisfiable in any model of cardinality less than \aleph_1 . For example, let \mathcal{L} be the first-order language with a countable set of constants $\{c_i : i \in \mathbb{N}\}$ and a countable set of function symbols $\{f_i : i \in \mathbb{N}\}$. Let \mathcal{M} be a model of \mathcal{L} with domain \mathbb{N} and let \mathcal{A} be a set of formulas in \mathcal{L} such that $\mathcal{M} \models \mathcal{A}$ and \mathcal{A} is not satisfiable in any model of cardinality less than \aleph_1 . Then \mathcal{A} is a set of first-order formulas in prenex normal form that are not satisfiable in any model of cardinality less than \aleph_1 .

Figure 1 displays 10 histograms showing the distribution of the number of non-zero elements in the vector x for different values of n (10, 20, 30, 40, 50, 60, 70, 80, 90, 100). The x-axis represents the number of non-zero elements (x), ranging from 0 to 100. The y-axis represents the count, ranging from 0 to 100. As n increases, the distribution becomes more concentrated around 0, with the peak count increasing significantly.
